

Instructions with a **double asterisk **** are in parallel branches with the holding circuit.

The diagram shows a parallel circuit. A vertical line on the left represents the main supply line. Two horizontal branches connect this vertical line to a common vertical line on the right. The top branch contains a battery (represented by two cells) in series with a resistor (represented by a rectangle). The bottom branch also contains a battery in series with a resistor. This represents two parallel branches, each with a battery and a resistor.

RUNG 0 - NETWORK 1: INDEX MOTOR (Requires holding circuit)

Signal to Index Feeder.

Internal for feeder in an active index table cycle requested.

Holding Circuit.

Breaks the holding circuit when detects index table has moved to next position.

continued

RUNG 1 - NETWORK 2: PART AT INDEX (Requires holding circuit)

_____ *	_____	Detects index table has moved to next position.
_____ *	_____	Sensor the detects there is a part at the index table.
_____	_____	Holding Circuit.
_____	_____	Breaks holding circuit when robot has removed part.

RUNG 2 - NETWORK 3: FEEDER REQUEST (Requires holding circuit)

_____	_____	Signal to index the feeder.
_____	_____	Holding Circuit.
_____	_____	Breaks the holding circuit when a part is detected at the index table.

RUNG 3 - NETWORK 4: NO PART REQUEST

_____	_____	Internal for feeder in an active index table cycle requested.
_____	_____	Detects index table has moved to next position.
_____	_____	Sensor the detects there is no part at the index table.

RUNG 4 - NETWORK 5: NO PART AT INDEX (Requires holding circuit)

_____	_____	No part request is active.
_____	_____	Holding Circuit.
_____	_____	Breaks holding circuit when part has been detected at the index table.
